

WORLD WATER COUNCIL

**RECOMMENDATIONS OF THE
INTERNATIONAL CONFERENCE ON
WORLD WATER RESOURCES AT THE BEGINNING OF
THE 21ST CENTURY**

WATER: A LOOMING CRISIS?

More than 300 water experts gathered in UNESCO, Paris, from 3 to 6 June 1998, to discuss matters of a possible global water crisis. The Conference was convened by the International Hydrological Programme (IHP) of UNESCO, the World Water Council and the International Association of Hydrological Sciences (IAHS). After four days of in-depth discussions, the Sense of the Conference was summarized as follows.

Water: a Looming Crisis?

Does the world face a looming water crisis? Yes. A new global assessment of regional freshwater resources confirms that a quarter of the world population still has no safe water supply and half lack adequate sanitation, and as a consequence people are still dying from lack of adequate water services and water related diseases. Global water quality is still declining and organic micro-pollutants continue to degrade ecosystems and habitats. Furthermore, water quality data is still unavailable in many parts of the world and inadequate in others, while in certain regions networks continue to degrade.

There are various crises. Certain parts of the World are experiencing growing scarcity, worsening pollution and over consumption, exacerbated by drought and floods; for example in the Sahel and lake Chad. Locally and regionally water resources are often exceeded by the demand for water. Demands for water services are growing and frequently along transboundary and international rivers. Population growth environmental change such as watershed degradation, including climate change, can make the prospects for continuing economic and social development look bleak. With increasing demands, managers face growing uncertainty and the prospect that their decisions will fail to provide water of adequate quantity and quality, and protect against floods, pollution events and water related diseases.

But trends are not destiny. A variety of human actions can mitigate this water crisis, change trends leading to greater crises and create opportunities for improving the quality of life, maintaining ecosystems and generating wealth and sustainable development.

A number of global gatherings have addressed water as a major issue, from the 1977 World Water Conference in Mar del Plata, Argentina, to Rio in 1992 and to recent Commission for Sustainable Development negotiations on freshwater. Many recommendations from these meetings have become the practice of certain international and national programs. But much remains to be done, especially to raise the salience of water issues to political decision-makers. This conference and its recommended actions are directed to the water community and policy makers.

Actions Needed

First, humanity must decide to take actions. Indeed, the water community is obligated to proactively seek such opportunities. Second, human actions must be taken within the framework of new partnerships among the full spectrum of users of water services, those who pay and those who benefit, political and technical professionals, ecosystems and engineering, citizens and private and public decision makers, and science and humanity. Third, actions must be participatory, transparent, creative and technically sound. Fourth, improved cost effectiveness and increasing confidence, new technology, new concepts and new ideas leading to increasing flexibility of water resources systems and the institutions that manage them are needed. Five, improved assessment and management of risk, increased reliability of traditional, technical and new demand orientated data, improved awareness of water and enhanced public participation are needed.

Better information on quantity and quality of surface and ground water, on-related areas, such as on the flora and fauna in water bodies is required. Integrated approaches to database and information management should be adopted. They should include data on natural and artificial flows. They should stress the importance of the length of record and the range of variables so those trends may be

identified. The variability of water resources in space and time, and not simply average conditions, should be available. Water related information systems should be integrated with other aspects of water management systems, especially on demand and use, and with information on comprehensive environmental management. Time and space scales of hydrological processes especially for groundwater are important.

While, participants acknowledged a basic human right to some minimum water need, quantifying that need is difficult. Water and sanitation budgets should be dramatically increased and come closer to commitments for defense and security.

The effects of human activities on water resources and the environment, in general, have to be separated from those resulting from the natural variability of climate. This is particularly important where water resources are already under great stress, such as in arid and semi arid areas. Stakeholder participation is vital to sustainable water resources management, backed by the development and implementation of new water laws. Effective policies to protect water resources, particularly groundwater sources, have to be launched.

Policy analysis using computer simulations and measures for analyzing current trends were seen as useful tools for addressing future water issues, but an integrated approach to planning for future water requirements was necessary. Such integrated approaches must consider the full spectrum of options, from structural (such as dams and channelization) to non-structural (such as conservation, pricing and bio-engineering).

A better understanding of the history of water management and its lessons is needed. Technical and non-technical people involved with water need to better communicate and educate each other. We need more and better training for younger generations. Continuing and increasing education coupled with technology transfer is needed. For example, lessons learned from floods in certain countries could provide assistance to others such as: infiltration facilities flood proofing techniques and quantitative precipitation forecasting. Protection by dikes is necessary on large rivers while effective warning and evacuation systems were vital in order to reduce the toll of deaths.

Improved and integrated water management requires better sense of the costs and value of water. Water pricing in agriculture, the dominant use of water world wide, highlights this need. Water is a social as well as an economic good. Participants debated the meaning of "value", "price", and economic good. Some suggested using services rather than economic good. Others suggested using opportunity costs. Participants agreed that water services should not be free of charge but paid for at a socially affordable level. However, that level will differ among cultures and circumstances.

A variety of institutional and legal systems exist which allow nations to make their own approaches to water resources management. They include public and private options, usership as opposed to ownership and demand management against needs based planning. Integrated water resources management has to take into account economic, social, cultural and environmental aspects along with principles such as "the polluter pays". While water markets function in some areas the viability of market mechanisms requires study. Participants called for a major world forum to debate the theoretical and practical issues behind the notion of water as an economic good.

While water offers potential for conflict, it provides a powerful tool for cooperation. Water has often been the vehicle for parties in adversarial relationships to talk. It has been and should be seen as a major opportunity for second track diplomacy and peace building.

These actions are directed to ongoing global efforts such as: the Intergovernmental Hydrological Programme (IHP) of UNESCO, the 1999 World Science Conference, the Water Vision of the World Water Council, the Second Global Assessment and the Encyclopedia of Life Support Systems.

International Conference on World Water Resources at the Beginning of the 21st Century
Water: a looming crisis?
UNESCO Paris 3-6 June 1998

FINAL LIST OF PARTICIPANTS
324 participants

Mr M.A. Abdel Khalek
Drainage Research Institute
National Water Research Center
P.O. Box 13621/5
Delta Barrages (El-Kanater)
Cairo, Egypt
Email: drains@idsc1.gov.eg
Fax: + 20 2 2189153
Tel: + 20 2 2189383

Mr J. Al-Sumait Abdulaziz
Deputy Director of Groundwater Projects
Administration
Ministry of Electricity and Water
Al-Riqui, Safat
State of Kuwait
Fax: + 965 4898328; Tel: + 965 4881639

Dr M. Abu Zeid
Minister of Public Works and Water Resources
Arab Republic of Egypt
Kornish el-Nil, Imbaba
Giza, 12666 Cairo
Egypt
Fax: + 20 2 3123257
Tel: + 20 2 3123248

Ms Muzaffer Adali
Chercheuse, journaliste
12, Rue du Bac
75007 Paris
France
Email: muzafferadali@hotmail.com
Fax: + 33 (0) 1 42 86 07 85
Tel: + 33 (0) 1 42 86 07 85

Dr A.J. Adeloye
Heriot-Watt University
Department of Civil and Offshore Engineering
Riccarton
Edinburgh EH14 4AS
United Kingdom
Email: a.j.adeloye@hw.ac.uk
Fax: + 44 131 451 5078
Tel: + 44 131 44 95 111

Mr Iyad Aflak
Permanent Delegation of Iraq to UNESCO
1, Rue Miollis
75015 Paris, France

Prof. A. Afouda
Président de l'Association Africaine d'Hydrologie
(AAH)
B.P. 7082 Cotonou
Benin
